

CJ6376 Series

■ INTRODUCTION

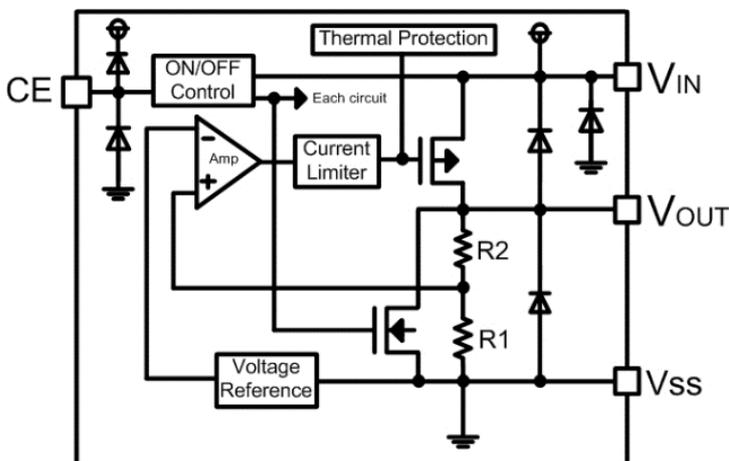

CJ6376 series is a group of positive voltage regulators manufactured by CMOS process, which has low power consumption and low voltage. Even if the input and output voltage difference is very small, it can also provide larger output current.

CJ6376 series can provide 300 mA output current and allow input voltage up to 36V. This series of products are very suitable for battery powered devices, such as RF applications and other systems requiring quiet voltage sources.

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltages are with respect to network ground terminal.

(3) This IC includes over temperature protection that is intended to protect the device during momentary overload. Junction temperature will exceed 125°C when over temperature protection is active. Continuous operation above the specified maximum operating junction temperature may impair device reliability.
