**Note 1:** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not guaranteed. For guaranteed specifications and the test conditions, see the Electrical Characteristics.

**Note 2:** Human Body Model,  $1.5\text{k}\Omega$  in series with  $100\text{pF}$

**Note 3:** The maximum power dissipation is a function of  $T_{J(\text{MAX})}$ ,  $\theta_{JA}$ , and  $T_A$ . The maximum allowable power dissipation at any ambient temperature is  $P_D = (T_{J(\text{MAX})} - T_A) / \theta_{JA}$ . All numbers apply for packages soldered directly onto a PC board.

**Note 4:** Typical Values represent the most likely parametric norm.

**Note 5:** All limits are guaranteed by testing or statistical analysis

**Note 6:** Machine model,  $0\Omega$  in series with  $200\text{pF}$

## Application Information

### CAPACITOR SELECTION

The recommended capacitors are  $0.1\mu\text{F}$ . However, larger capacitors for the charge pump may be used to minimize ripples on  $V_+$  and  $V_-$  pins.

### POWER SUPPLY DECOUPLING

In some applications that are sensitive to power supply noise from the charge pump, place a decoupling capacitor,  $C_{bp}$ , from  $V_S$  to GND. Use at least a  $0.1\mu\text{F}$  capacitor or the same size as the charge pump capacitors ( $C1 - C4$ ).

### CHARGED PUMP

The dual internal charged-pump provides the  $\pm 10\text{V}$  to the transmitters. Using capacitor  $C1$ , the charge pump converts  $+5\text{V}$  to  $+10\text{V}$  then stores the  $+10\text{V}$  in capacitor  $C3$ . The charge pump uses capacitor  $C2$  to invert the  $+10\text{V}$  to  $-10\text{V}$ . The  $-10\text{V}$  is then stored in capacitor  $C4$ .
