### XBLW SN74LS190

Presetable Synchronous  
BCD Decade up/down Counter

## Description

The SN74LS190 is a asynchronously presettable up/down BCD decade counters. They contain four master/slave flip-flops with internal gating and steering logic to provide asynchronous preset and synchronous count-up and count-down operation.

Asynchronous parallel load capability permits the counter to be preset to any desired number. Information present on the parallel data inputs (D0 to D3) is loaded into the counter and appears on the outputs when the parallel load ( $\bar{PL}$ ) input is LOW. As indicated in the function table, this operation overrides the counting function.

Counting is inhibited by a HIGH level on the count enable ( $\bar{CE}$ ) input. When  $\bar{CE}$  is LOW internal state changes are initiated synchronously by the LOW-to-HIGH transition of the clock input. The up/down ( $\bar{U}/\bar{D}$ ) input signal determines the direction of counting as indicated in the function table. The  $\bar{CE}$  input may go LOW when the clock is in either state, however, the LOW-to-HIGH  $\bar{CE}$  transition must occur only when the clock is HIGH. Also, the  $\bar{U}/\bar{D}$  input should be changed only when either  $CE$  or  $CP$  is HIGH. Overflow/underflow indications are provided by two types of outputs, the terminal count (TC) and ripple clock ( $\bar{RC}$ ). The TC output is normally LOW and goes HIGH when a circuit reaches zero in the count-down mode or reaches "9" in the count-up-mode. The TC output will remain HIGH until a state change occurs, either by counting or presetting, or until  $\bar{U}/\bar{D}$  is changed. Do not use the TC output as a clock signal because it is subject to decoding spikes. The TC signal is used internally to enable the  $\bar{RC}$  output. When TC is HIGH and  $\bar{CE}$  is LOW, the  $\bar{RC}$  output follows the clock pulse (CP). This feature simplifies the design of multistage counters as shown in Figure 5 and 6.

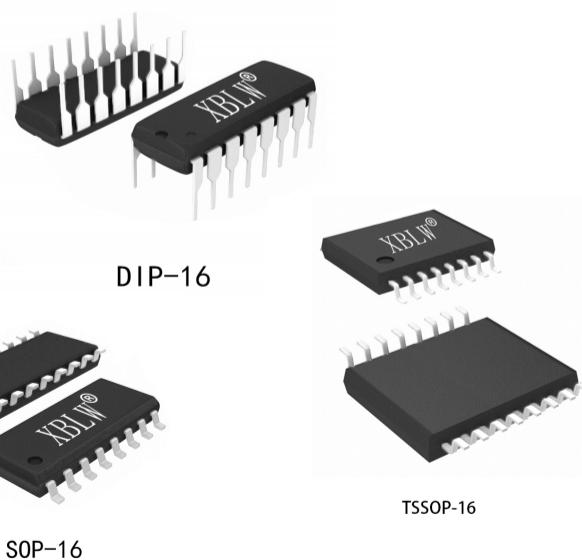

In Figure 5, each  $\bar{RC}$  output is used as the clock input to the next higher stage. It is only necessary to inhibit the first stage to prevent counting in all stages, since a HIGH On  $CE$  inhibits the  $\bar{RC}$  output pulse as indicated in the function table. The timing skew between state changes in the first and last stages is represented by the cumulative delay of the clock as it ripples through the preceding stages. This can be a disadvantage of this configuration in some applications.

Figure 6 shows a method of causing state changes to occur simultaneously in all stages. The  $\bar{RC}$  outputs propagate the carry/borrow signals in ripple fashion and all clock inputs are driven in parallel. In this configuration the duration of the clock LOW state must be long enough to allow the negative-going edge of the carry/borrow signal to ripple through to the last stage before the clock goes HIGH. Since the  $\bar{RC}$  output of any package goes HIGH shortly after its  $CP$  input goes HIGH there is no such restriction on the HIGH-state duration of the clock.

In Figure 7, the configuration shown avoids ripple delays and their associated restrictions. Combining the TC signals from all the preceding stages forms the  $\bar{CE}$  input for a given stage. An enable must be included in each carry gate in order to inhibit counting. The TC output of a given stage is not affected by its own  $\bar{CE}$  signal therefore the simple inhibit scheme of Figure 5 and 6 does not apply.

## Features

- Synchronous reversible counting
- Asynchronous parallel load
- Count enable control for synchronous expansion
- Single up/down control input
- Specified from -20°C to +85°C
- Packaging information: DIP-16/SOP-16/TSSOP-16

## Statement

- XBLW reserves the right to modify the product manual without prior notice! Before placing an order, customers need to confirm whether the obtained information is the latest version and verify the completeness of the relevant information.
- Any semi-guide product is subject to failure or malfunction under specified conditions. It is the buyer's responsibility to comply with safety standards when using XBLW products for system design and whole machine manufacturing. And take the appropriate safety measures to avoid the potential in the risk of loss of personal injury or loss of property situation!
- XBLW product has not been licensed for life support, military and aerospace applications, and therefore XBLW is not responsible for any consequences arising from its use in these areas.
- If any or all XBLW products (including technical data, services) described or contained in this document are subject to any applicable local export control laws and regulations, they may not be exported without an export license from the relevant authorities in accordance with such laws.
- The specifications of any and all XBLW products described or contained in this document specify the performance, characteristics, and functionality of said products in their standalone state, but do not guarantee the performance, characteristics, and functionality of said products installed in Customer's products or equipment. In order to verify symptoms and conditions that cannot be evaluated in a standalone device, the Customer should ultimately evaluate and test the device installed in the Customer's product device.
- XBLW documentation is only allowed to be copied without any alteration of the content and with the relevant authorization. XBLW assumes no responsibility or liability for altered documents.
- XBLW is committed to becoming the preferred semiconductor brand for customers, and XBLW will strive to provide customers with better performance and better quality products.
