

## CURRENT MODE PWM CONTROLLER

### DESCRIPTION

The UC3842B/43B/44B/45B are fixed frequency current mode PWM controller. They are specially designed for OFF-Line and DC to DC converter applications with a minimal external components. Internally implemented circuits include a trimmed oscillator for precise duty cycle control, a temperature compensated reference, high gain error amplifier, current sensing comparator, and a high current totem pole output ideally suited for driving a power MOSFET. Protection circuitry includes built under voltage lockout and current limiting.

The UC3842B, UC3844B have UVLO thresholds of 16 V (on) and 10 V (off).

The corresponding thresholds for the UC3843B, UC3845B are 8.4V (on) and 7.6V (off).

The UC3842B, UC3843B can operate within 100% duty cycle.

The UC3844B, UC3845B can operate within 50% duty cycle.

The UC3842B/43B/44B/45B is characterized for operation from TA = -40°C to 85°C.

## PIN CONNECTION

## PIN FUNCTION

N	FUNCTION	DESCRIPTION
1	COMP	This pin is the Error Amplifier output and is made for loop compensation.
2	$V_{FB}$	This is the inverting input of the Error Amplifier. It is normally connected to the switching power supply output through a resistor divider.
3	$I_{SENSE}$	A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction.
4	$R_T/C_T$	The oscillator frequency and maximum Output duty cycle are programmed by connecting resistor $R_T$ to $V_{ref}$ and capacitor $C_T$ to ground.
5	GROUND	This pin is the combined control circuitry and power ground.
6	OUTPUT	This output directly drives the gate of a power MOSFET. Peak currents up to 1A are sourced and sink by this pin.
7	$V_{CC}$	This pin is the positive supply of the integrated circuit.
8	$V_{ref}$	This is the reference output. It provides charging current for capacitor $C_T$ through resistor $R_T$ .
